Basic concepts of Information Technology

Overview of the Computer System

S.M. Vidanagamachchi

Learning Objectives

- Identify components of the computer system and functions of them correctly
- Define system software and application software
- Identify computer communication networks
- Discuss professional and ethical issues in IT

Main Readings

- Computer Organization and Architecture Designing for Performance (8th Edition) - William Stallings
- Computer Fundamentals Architecture and Organization , Edition 3 - Ram B

Evaluation Criteria

- 15 Lecture Hours
- 1 Credit
- 100% - Final Exam (2 Questions)

Overview of the Computer System

◆ Evolution of Digital Computers

◆ Classification of Computers

◆ Main components of a Computer

◆ Functions of Computers

The Computer

◈ A general purpose, programmable electronic device that automatically carries out a sequence of arithmetic and logical operations

Generations of Computers

◆ Computer evolution: Five generations

◆ Technological developments over time

◆ Changes resulting in terms of:
- Size
- Price
- Power
- Efficiency
- Reliability

First Generation (1940-1950)

- Vacuum tubes/ electronic valves- circuitry
- Magnetic drums- memory
- Punched tape- input or output
- Expensive, bulky, unreliable power guzzlers
- Relied on machine language
- Very large, a lot of space for installation
- Solve one problem at a time
- Generated a large amount of heat, non-profitable and very slow
- Eg: ENIAC,UNIVAC I, UNIVAC II, UNIVAC 1101

8

Second Generation(1950-1960)

- Transistors- CPU components
- Ferrite cores- Main memory
- Magnetic disks and tapes- Secondary memory
- Smaller, faster, cheaper, more energy-efficient and more reliable
- Assembly language, early versions of FORTRAN, ALGOL and COBOL
- Stored instructions in memory
- Eg:- UNIVAC 1107, UNIVAC III, RCA 501, IBM 1401

Third Generation(1960-1970)

- Integrated Circuits(ICs)-SSI and MSI– CPU components
- Magnetic core memories and Semiconductor memories (RAMs and ROMs)
- Magnetic disks and tapes- Secondary memory
- Cache memory was incorporated
- Microprogramming, parallel processing, multiprocessing, multiprogramming, multiuser system were introduced
- Concept of virtual memory was introduced
- Small in size, consume less power and less heat generation
- Processing time reduced: microseconds to nanoseconds
- Eg:- CDC 7600, PDP II (16 bit mini computer)

Fourth Generation(1971-present)

◆ VLSI - CPU, memory and supporting chips

◆ Microprocessors – CPU

◆ Clock Frequency – 400 to 1000 MHz

◆ FPU (Floating Point Unit) and MMU (Memory Management Unit)

◆ Two level cache memory (L1 and L2)

◆ GUIs, mouse, Handheld devices

◆ Very small, cheapest, portable and quite reliable

◆ Generate negligible amount of heat, low production cost

◆ 1980- IBM personnel computer, 1894 Apple's Macintosh

◆ Eg:- IBM RISC 6000, IBM RT

Fifth Generation(Present & beyond)

◈ Based on Artificial Intelligence

◈ Use ultra large scale integrated (ULSI) chips

◈ Use Intelligent programming, knowledge based problem solving techniques, high performance multiprocessor systems, Improved human-machine interfaces

◈ Solve highly complex problem including decision making, logical reasoning

◈ Understand natural languages(Eg: English, Spanish..)

◈ Voice recognition

◈ Use more than one CPU

Computer Types: Classification

- Supercomputers
- Mainframe computers
- Minicomputers
- Microcomputers
- Embedded computers/ Embedded systems

Supercomputer

- Most powerful computer
- Use for very complex tasks
  - Plasma and nuclear analysis, weapon development, sending rockets into space, weather forecasting
- Very expensive and fast
- Eg:- Cray I , Cray II, Blue Pacific- IBM's

Mainframe Computer

◆ Large and expensive

◆ Capable of supporting hundreds/thousands of users simultaneously

- Big hospitals, air line reservations companies and many other huge companies

Mark I mainframe- 1950

Supercomputer Vs Mainframe

◆ Supercomputer: focus on problems which are limited by calculation speed

   Mainframe: focus on problems which are limited by input/output and reliability

◆ Supercomputer: optimized for complicated computations that take place largely in memory Eg:- weather forecasting

   Mainframe: Optimized for comparatively simple computations involving huge amounts of external data

   Eg:-insurance, business or payroll processing applications

Supercomputer Vs Mainframe...

◆ Supercomputer: often purpose-built for one or a very few specific institutional tasks E.g. simulation and modeling

Mainframe: typically handles a wider variety of tasks

◆ Both have parallel processing

Supercomputer: typically exposed it to the programmer in complex manners

Mainframe: typically use it to run multiple tasks

Minicomputer

◆ Middle sized computer

◆ Multiprocessing system capable of supporting approximately from 4 to 200 users simultaneously

Mainframe Vs Minicomputer

- Minicomputers are general purpose computer systems with reduced storage capacity and performance as compare to mainframe computers

Microcomputer

- Personal computer; designed to be used by individuals
- Low cost, small in size
- Depends on a microprocessor
- Two types: Desktop and Portable (PCs, Laptops, PDAs, Workstations)

Desktop Microcomputer

◆ A microcomputer intended to use at a single location rather than a portable computer

◆ Tower casing/ desktop casing

Workstation

- A powerful PC designed for a specific task
  - Engineering applications ; eg:- CAD and CAM
  - DTP
- In terms of computing power, workstations lie between personal computers and minicomputers
- Typically link together to form a Local Area Network(LAN)

Server

◆ A computer that serves requested services to users (clients)

◆ Clients- running in the same computer or connecting through a LAN
Portable Computers

- Laptops
- Palmtops : PDA / Handheld
- ???

Laptop Computer

◆ Small in size, compact and light in weight

◆ More expensive than a comparable desktop

PDA

- A palmtop computer; fits into a pocket run on batteries
- Employs touchscreen technology for entering data, a memory card slot for data storage, and IrDA, Bluetooth and/or Wi-Fi
- Can synchronize data with applications on a user's personal computer (as a backup)

Minicomputer Vs Microcomputer

◆ Minicomputer: occupy a large area within a room and support multiple users simultaneously

Microcomputer: small in size, generally one user

Embedded Computer

◆ Designed for specific control functions within a larger system

◆ Range from portable devices such as digital watches, MP3 players to large stationary installations like traffic lights, the systems controlling nuclear power plants, mobile robots
